7.2 Create a New Event Log.....	9

Chapter 7 Event Log

“Event log” is used to define the content of an event and the conditions triggering it. In EB8000, this triggered event, also called “alarm”, and its processing procedure can be saved to designated places such as HMI memory storage or external memory device. The saved file is with a name in a format as EL yyyyymmdd.evt. In this name, yyyyymmdd records the time that this file is built, and will be set automatically by the system. Take file name EL_20100524.evt as an example, this shows that this created file records the event occurred on 24th of May, 2010.

EB8000 also provides the following system address tags to manage the event log:

- [LB-9021] reset current event log (set ON)
- [LB-9022] delete the earliest event log file (set ON)
- [LB-9023] delete all event log files (set ON)
- [LB-9024] refresh event log information (set ON)
- [LW-9060] no. of event log files
- [LW-9061] size of event log files

7.1 Event Log Management

With objects like [Alarm Bar], [Alarm Display] and [Event Display], users are able to clearly understand the life cycle of the whole event from happening, waiting for processing, until the alarm stops. Before using these objects, the content of an event has to be defined first.

Click the **[Alarm (Event Log)]** icon, and the dialog appears as below:

Alarm (Event) Log

Category : All [0]

No.	Category	Text	Mode	Condition	Read address	Notification address	Buzzer
-----	----------	------	------	-----------	--------------	----------------------	--------

☒ Enable back light when alarm occurs

History files

☒ Save to HMI memory ☐ Save to CF card ☐ Save to USB 1 ☐ Save to USB 2

☐ Preservation limit

Print

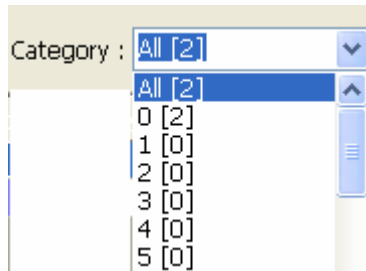

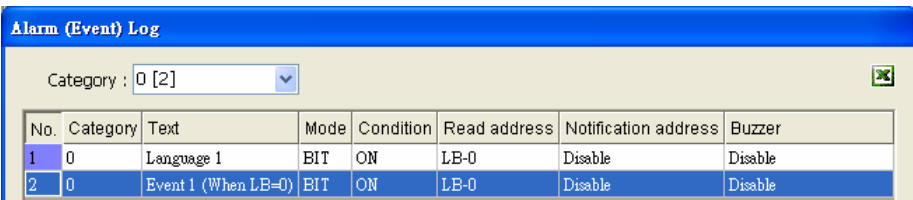

☒ Sequence no.

☒ Event trigger time ☐ HH:MM:SS ☒ HH:MM ☐ DD:HH:MM

☒ Event trigger date ☐ MM/DD/YY ☒ DD/MM/YY ☐ DD.MM.YY ☐ YY/MM/DD

New... Insert... Delete Settings...

Copy Paste Export... Import... Exit

Setting	Description																								
Category	<p>EB8000 classifies events. All events are divided into categories 0~255. [Alarm Bar], [Alarm Display], and [Event Display] can be used to restrain which category to display.</p> <p>[Category] is for selecting which category of the events to be displayed.</p> <div></div> <p>The [2] of 0[2] in this illustration demonstrates there are two defined events in category 0.</p> <div></div> <table><tr><th>No.</th><th>Category</th><th>Text</th><th>Mode</th><th>Condition</th><th>Read address</th><th>Notification address</th><th>Buzzer</th></tr><tr><td>1</td><td>0</td><td>Language 1</td><td>BIT</td><td>ON</td><td>LB-0</td><td>Disable</td><td>Disable</td></tr><tr><td>2</td><td>0</td><td>Event 1 (When LB=0)</td><td>BIT</td><td>ON</td><td>LB-0</td><td>Disable</td><td>Disable</td></tr></table>	No.	Category	Text	Mode	Condition	Read address	Notification address	Buzzer	1	0	Language 1	BIT	ON	LB-0	Disable	Disable	2	0	Event 1 (When LB=0)	BIT	ON	LB-0	Disable	Disable
No.	Category	Text	Mode	Condition	Read address	Notification address	Buzzer																		
1	0	Language 1	BIT	ON	LB-0	Disable	Disable																		
2	0	Event 1 (When LB=0)	BIT	ON	LB-0	Disable	Disable																		
History files	<p>Determine the storage device of an event log. However, when users simulate the project in PC, the files will be saved under the same event log subdirectory as EasyBuilder8000.exe.</p> <p>[Save to HMI memory] Save the event log data in MT8000 memory.</p> <p>[Save to SD card] Save the event log data in SD card.</p> <p>[Save to USB 1] Save the event log data in USB disk 1. Numbering rule of USB disk is: the disk inserted to the USB interface in the first place is numbered 1, next is numbered 2 and the last is numbered 3. It is not related to the interface position.</p> <p>[Save to USB 2] Save the event log data in USB disk 2.</p> <p>[Preservation limit] After choosing the device to save the Event log, users can see the</p>																								

	<p>[Preservation limit] selection. This setting determines how many days the data to be preserved.</p> <p>For example, the preservation time is set two days, which means HMI memory will keep the data of yesterday and the day before yesterday. Data that is not built in this period will be deleted automatically to prevent the storage space from running out.</p> <p><input checked="" type="checkbox"/> Preservation limit Days of preservation : <input type="text" value="2"/> day(s)</p>
Print	<p>To enable this setting, users have to finish the settings of printer in [system parameter settings].</p> <p>Print</p> <p><input checked="" type="checkbox"/> Sequence no.</p> <p><input checked="" type="checkbox"/> Event trigger time <input type="radio"/> HH:MM:SS <input checked="" type="radio"/> HH:MM <input type="radio"/> DD:HH:MM</p> <p><input checked="" type="checkbox"/> Event trigger date <input type="radio"/> MM/DD/YY <input checked="" type="radio"/> DD/MM/YY <input type="radio"/> DD.MM.YY <input type="radio"/> YY/MM/DD</p>

7.1.1 Excel Editing

Alarm (Event) Log

Category : 

There is an Excel icon in the top-right corner of the **[Alarm (Event Log) dialog]** for users to edit an Event log through Excel. An editing procedure includes: Edit in Excel, Import from Excel to Event Log and Export to Excel.

A. Edit in Excel

EB8000 provides a standardized sample of Excel in C:\EB8000\EventLogExample.xls for users to edit alarm (event) log. The sample includes some dropdown lists for an easier usage

	A	B	C	D	E	F	G	H	I	J	K
1	Category	Priority level	Address type	PLC name	Device type	System tag	User-defined tag	Address	Index	Data Format	Enab
2	0	Middle	Word	Local HMI	EMO	False	False	22	null	32-bit Signed	True
3	1	Low	Bit	Local HMI	LB-9009 : initialized as ON	True	True	122	IDX 1	16-bit BCD	False
4	2	High	Word	Local HMI	RWI	False	False	2222	IDX 4	32-bit BCD	True
5										16-bit BCD	
6										16-bit Unsigned	
7										16-bit Signed	
										32-bit Unsigned	
										32-bit Signed	

Caution:

1. **[System tag]** and **[User-defined tag]** can not be set true simultaneously. If both of them are set true, the system will view System tag to be true and User-defined tag to be false. If Device type is set as User-defined tag, please set System tag to be false.
2. The format of Color is R: G: B. the values of R, G, and B should be integer from 0 to 255.
3. Click Excel icon to open EventLogExample.xls

**B. Import from Excel to Event log**

Click **[Import excel button]** to import Excel file to Event log.

Alarm (Event) Log

Category : All [0] ▼

No.	Category	Text	Mode	Condition	Read address	Notification address	Buzzer

☒ Enable back light when alarm occurs

History files

☒ Save to HMI memory ☐ Save to CF card ☐ Save to USB 1 ☐ Save to USB 2

☒ Preservation limit Days of preservation : 7 day(s)

Print

☒ Sequence no.

☒ Event trigger time ☐ HH:MM:SS ☒ HH:MM ☐ DD:HH:MM

☒ Event trigger date ☐ MM/DD/YY ☒ DD/MM/YY ☐ DD.MM.YY ☐ YY/MM/DD

Caution:

1. When user-defined tag is set true in Excel, the system will compare this device type with the user-defined tag in system. If no suitable tag can be found, the system will set the user defined tag in event log to be false.
2. Before importing library (label library and sound library), please make sure library names exist in the system, otherwise the system will simply use the file name of the imported excel file.

C. Export to Excel

Click **[Export excel button]** to export data in Event log to excel.

Alarm (Event) Log

7.2 Create a New Event Log

Click **[New...]**; **[Event Log]** dialog appears with two tabs.

[General] tab:

Alarm (Event) Log

General Message

Category : 0 Priority level : Low

Address type : Word

Read address

PLC name : Local HMI Setting...

Address : LW 0 16-bit Unsigned

Notification

☒ Enable ☐ Set ON ☐ Set OFF

PLC name : Local HMI Setting...

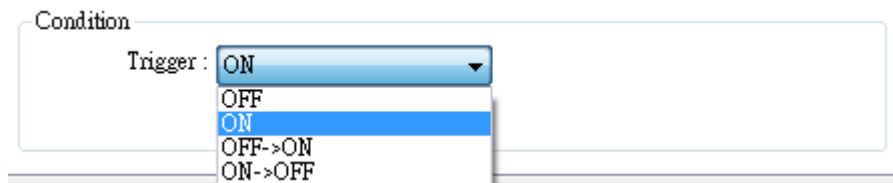

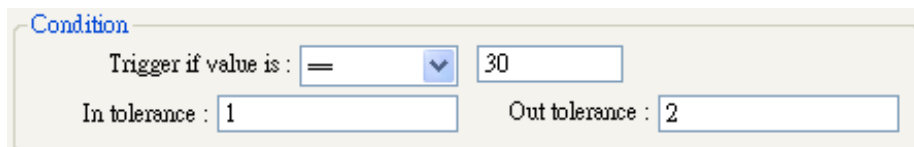

Address : LB 0

Condition

Trigger if value is : = 0

In tolerance : 0.1 Out tolerance : 0.2

Setting	Description
Category	The category of an event.
Priority level	The priority of an event: Users can define [Low] , [Middle] , [High] , or [Emergency] according to the importance of the event. When the number of event log equals to the max number available in the system, the less important events (lower priority) will be deleted and new events will be added in. (the default is 1000, please refer to “General” in “Chapter 5 System Parameters” to set this number)
Address type	The type of address— [Bit] or [Word] mode.
Read address	By reading the address set here, system obtains a value and will use it to check if an event reaches the condition to be triggered. Please refer to

	“Chapter 9 Object General Properties” for more information.
Notification	When an event is triggered, the specific message is sent out from Notification address. Select [Set ON] to send ON message to this address or select [Set OFF] to send OFF message to this address. Please refer to “Chapter 9 Object General Properties” for detail.
Condition	<p>The trigger condition of an event. When [Address type] of an event is [Bit], then [ON] or [OFF] in [Trigger] can be selected. The illustration below shows if Trigger [ON] is selected, and the status of [Read address] changes from OFF to ON, an event will be triggered and generate an event log record (or an alarm).</p>  <p>When the [Address type] of an event is [Word], several selections are available as follows:</p>  <p>Under the condition, system will read values from [Read address] and compare them with the trigger conditions to decide if an event is to be triggered. If the trigger condition is set as [==] or [<>], [In tolerance] and [Out tolerance] need be set while [In tolerance] is used as trigger condition and [Out tolerance] is used as system's normal condition.</p> <p>Example 1:</p>  <p>The illustration above indicates that if the value of [Read address] is greater or equal to 29(=30-1), or less or equal to 31(=30+1), the event</p>

will be triggered.

$$29 \leq [\text{Read address}] \text{ value} \leq 31$$

After the event is triggered, only when the value of [Read address] is greater than 32(=30+2) or less than 28(=30-2) will the system return to normal condition.

$$[\text{Read address}] \text{ value} < 28 \text{ or } [\text{Read address}] \text{ value} > 32$$

Example 2:

Condition

Trigger if value is :

In tolerance : Out tolerance :

Take another example above, it indicates that the event is triggered when the value of [Read address] is less than 29(=30-1) or greater than 31(=30+1).

$$[\text{Read address}] \text{ value} < 29 \text{ or } [\text{Read address}] \text{ value} > 31$$

When the event is triggered, system returns to normal condition only when the value of [Read address] is greater or equal to 28(=30-2), or less or equal to 32(=30+2).

$$28 \leq [\text{Read address}] \text{ value} \leq 32$$
